Where do we stand?

- Deep, large diameter well (~200 open hole)
- O_{PDC} dominated by secondary porosity
- Many potential sources
- Uncertain groundwater flow direction (transients)

Immediate Concerns

- Safeguard Municipal Drinking Water Supply
- Private Wells
 - Well Inventory
 - Sampling

Workplan

- Integrity of well construction
- Vertical and horizontal distribution of contaminants (attempt source identification)
 - MPCA / STS Consultants
- Analysis of hydraulically active intervals of the Prairie du Chien-Jordan

Downhole Investigations

- Video logging
- Borehole geophysics
- Discrete interval sampling
- Flowmeter logging
- Hydrolab (chemical) profiling

Hydrolab Probe

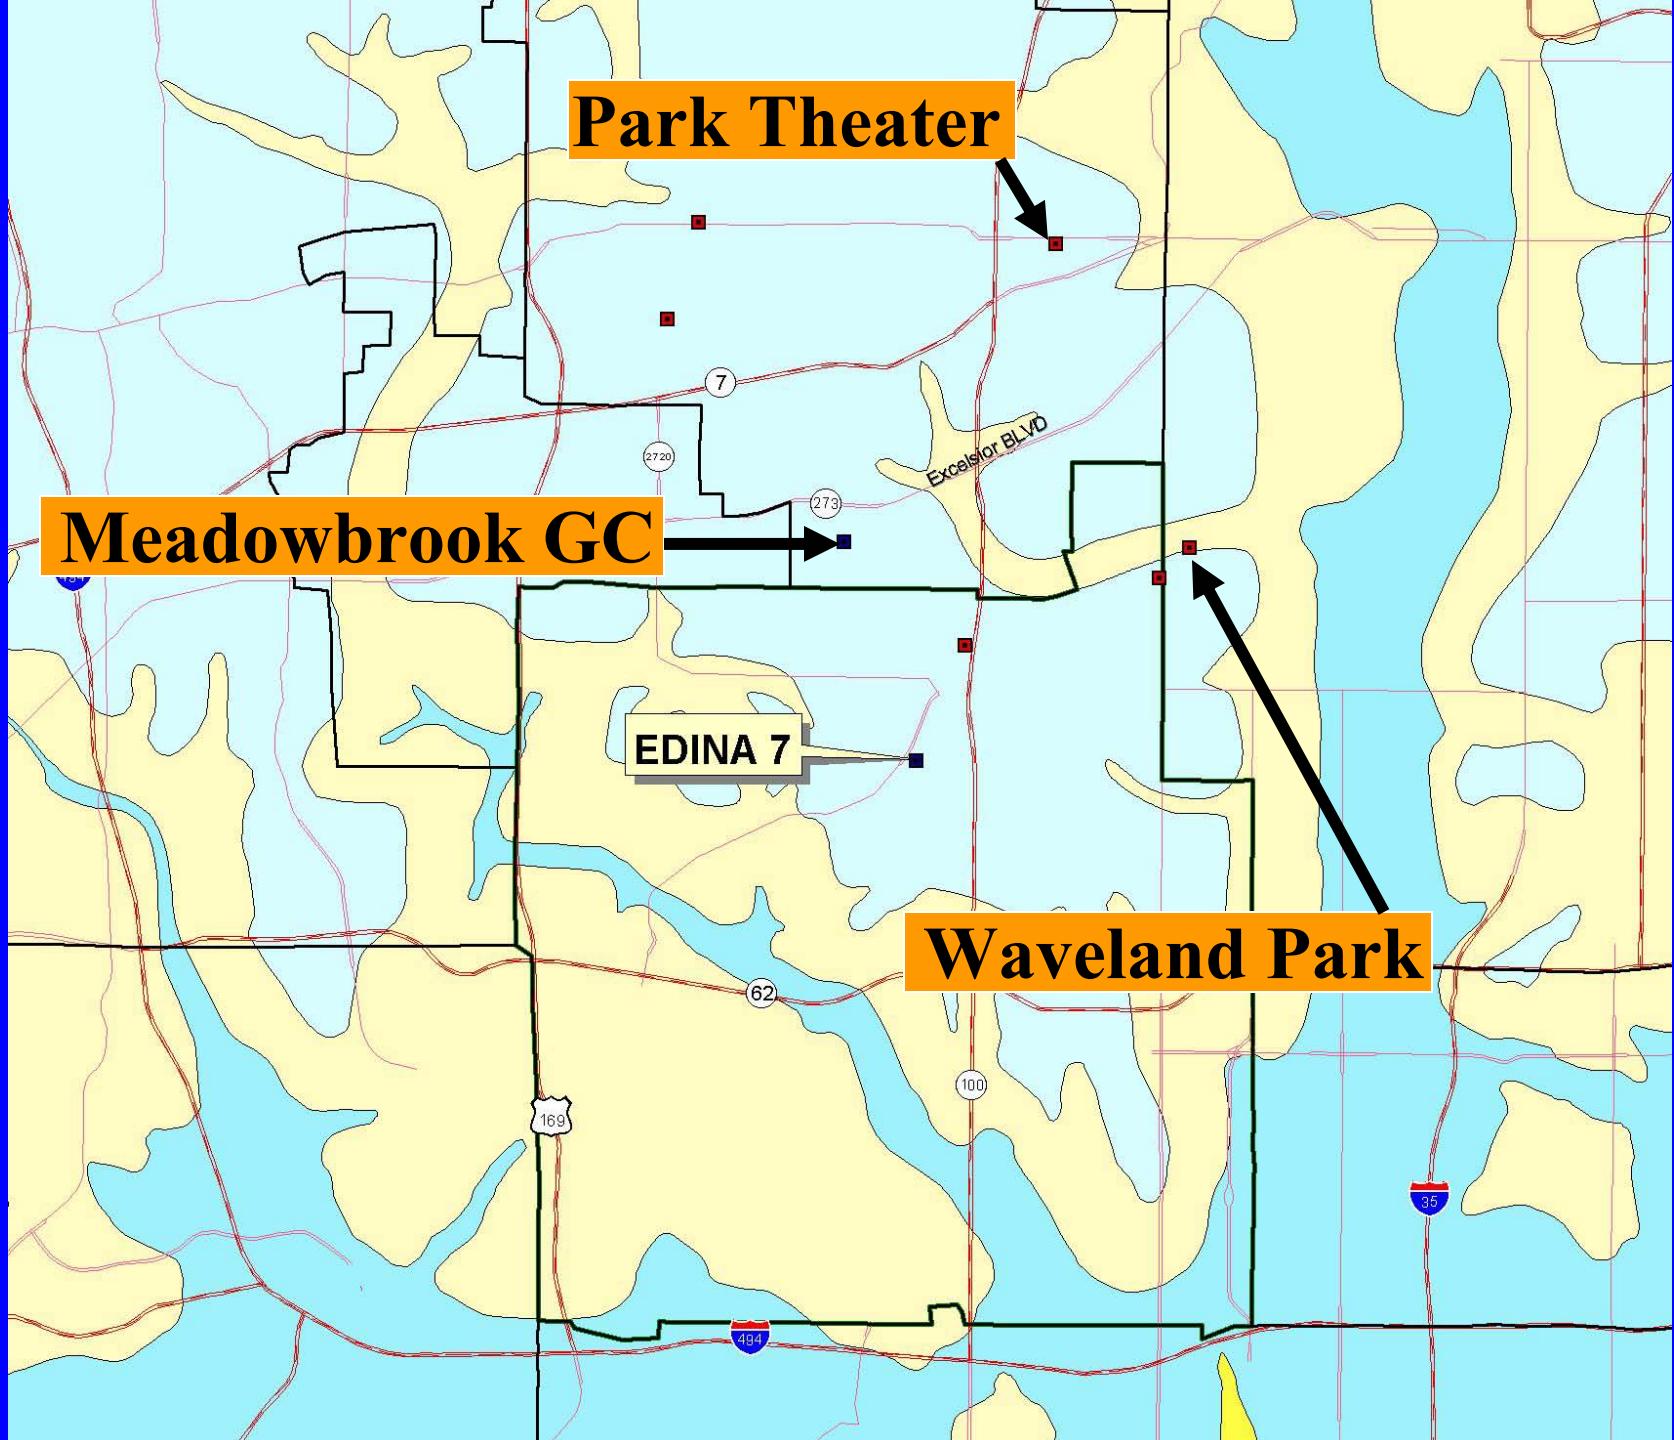

- Seven parameters:
 - Specific conductance
 - pH
 - Dissolved oxygen
 - ORP
 - Temperature
 - Chloride
 - Pressure
- Rapid measurements saved to computer

Borehole Profile, Caliper Log

Chemical Profile of Edina Well No. 7

Chemical Profile of Edina Well No. 7

Conclusions

- Borehole chemical profiling works well
- Hydraulically active zones of Opdc identified
- VOCs introduced into Edina No. 7 at specific stratigraphic levels
- Dead tritium, other chemical data, indicate hydraulically separate horizons in Opdc.

Continuing Investigative Activities

- Continue to make borehole chemical profiles over larger area
- Understanding hydraulic transients
- Plume mapping/source identification
 - AIH Seminar: 23 November, 2005; P. Rzepecki and L. Guo
 - Room 225 of the Biosystems and Agricultural Engineering Bldg. on the St. Paul campus.
