

Using Geochemistry to Sort Out Bedrock Aquifer Frameworks

MGWA Fall Conference 2007

Bob Tipping

Minnesota Geological Survey

University of Minnesota

- Chemical data provide a valuable tool for tracing ground-water flow paths
- Deviations from background concentrations help identify zones of preferential flow within bedrock aquifers
- Recognizing regional patterns in chemical data help refine conceptual models of ground-water flow

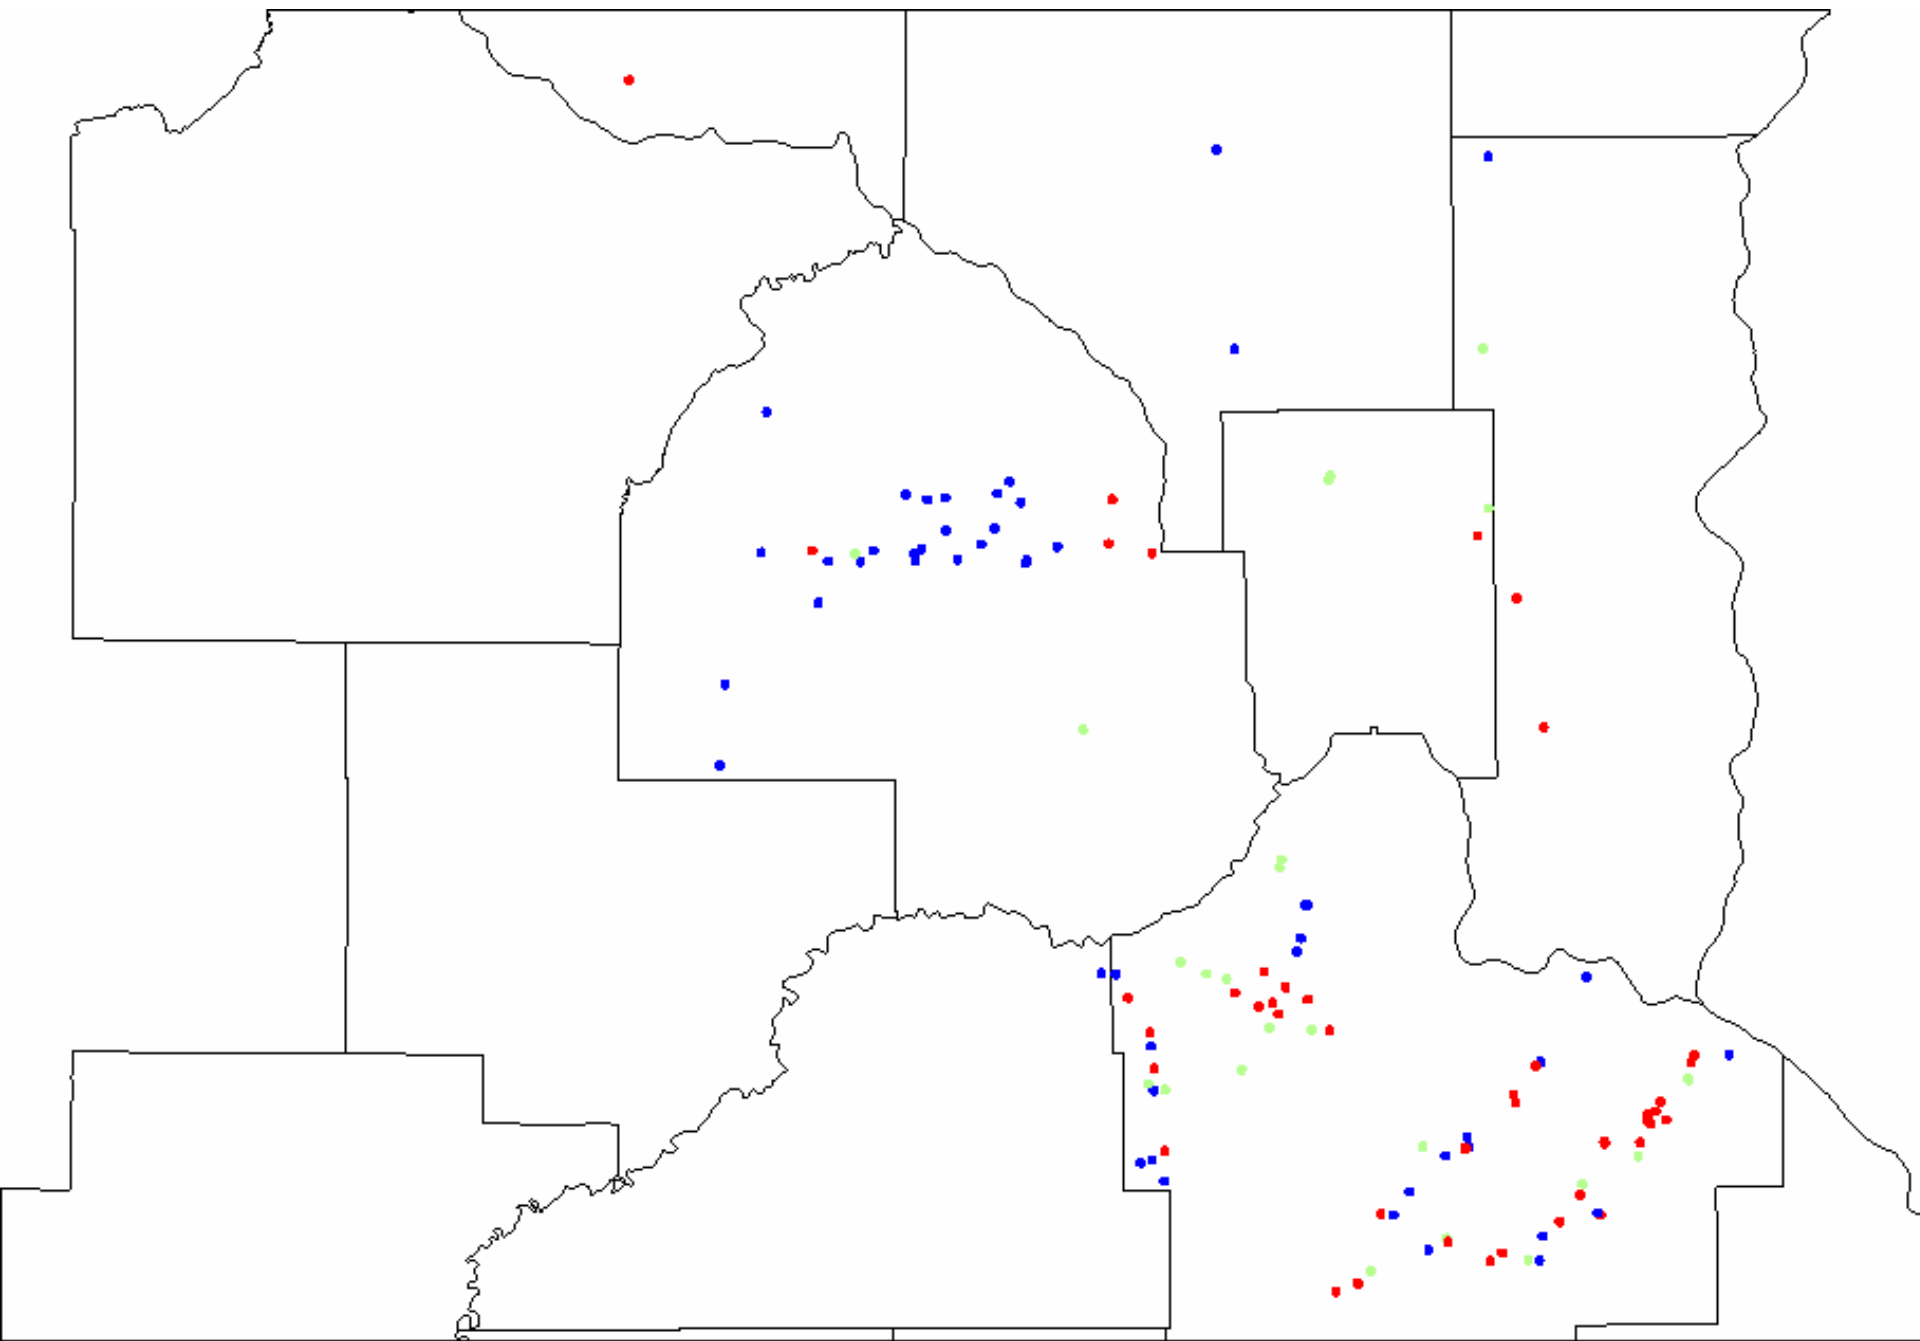

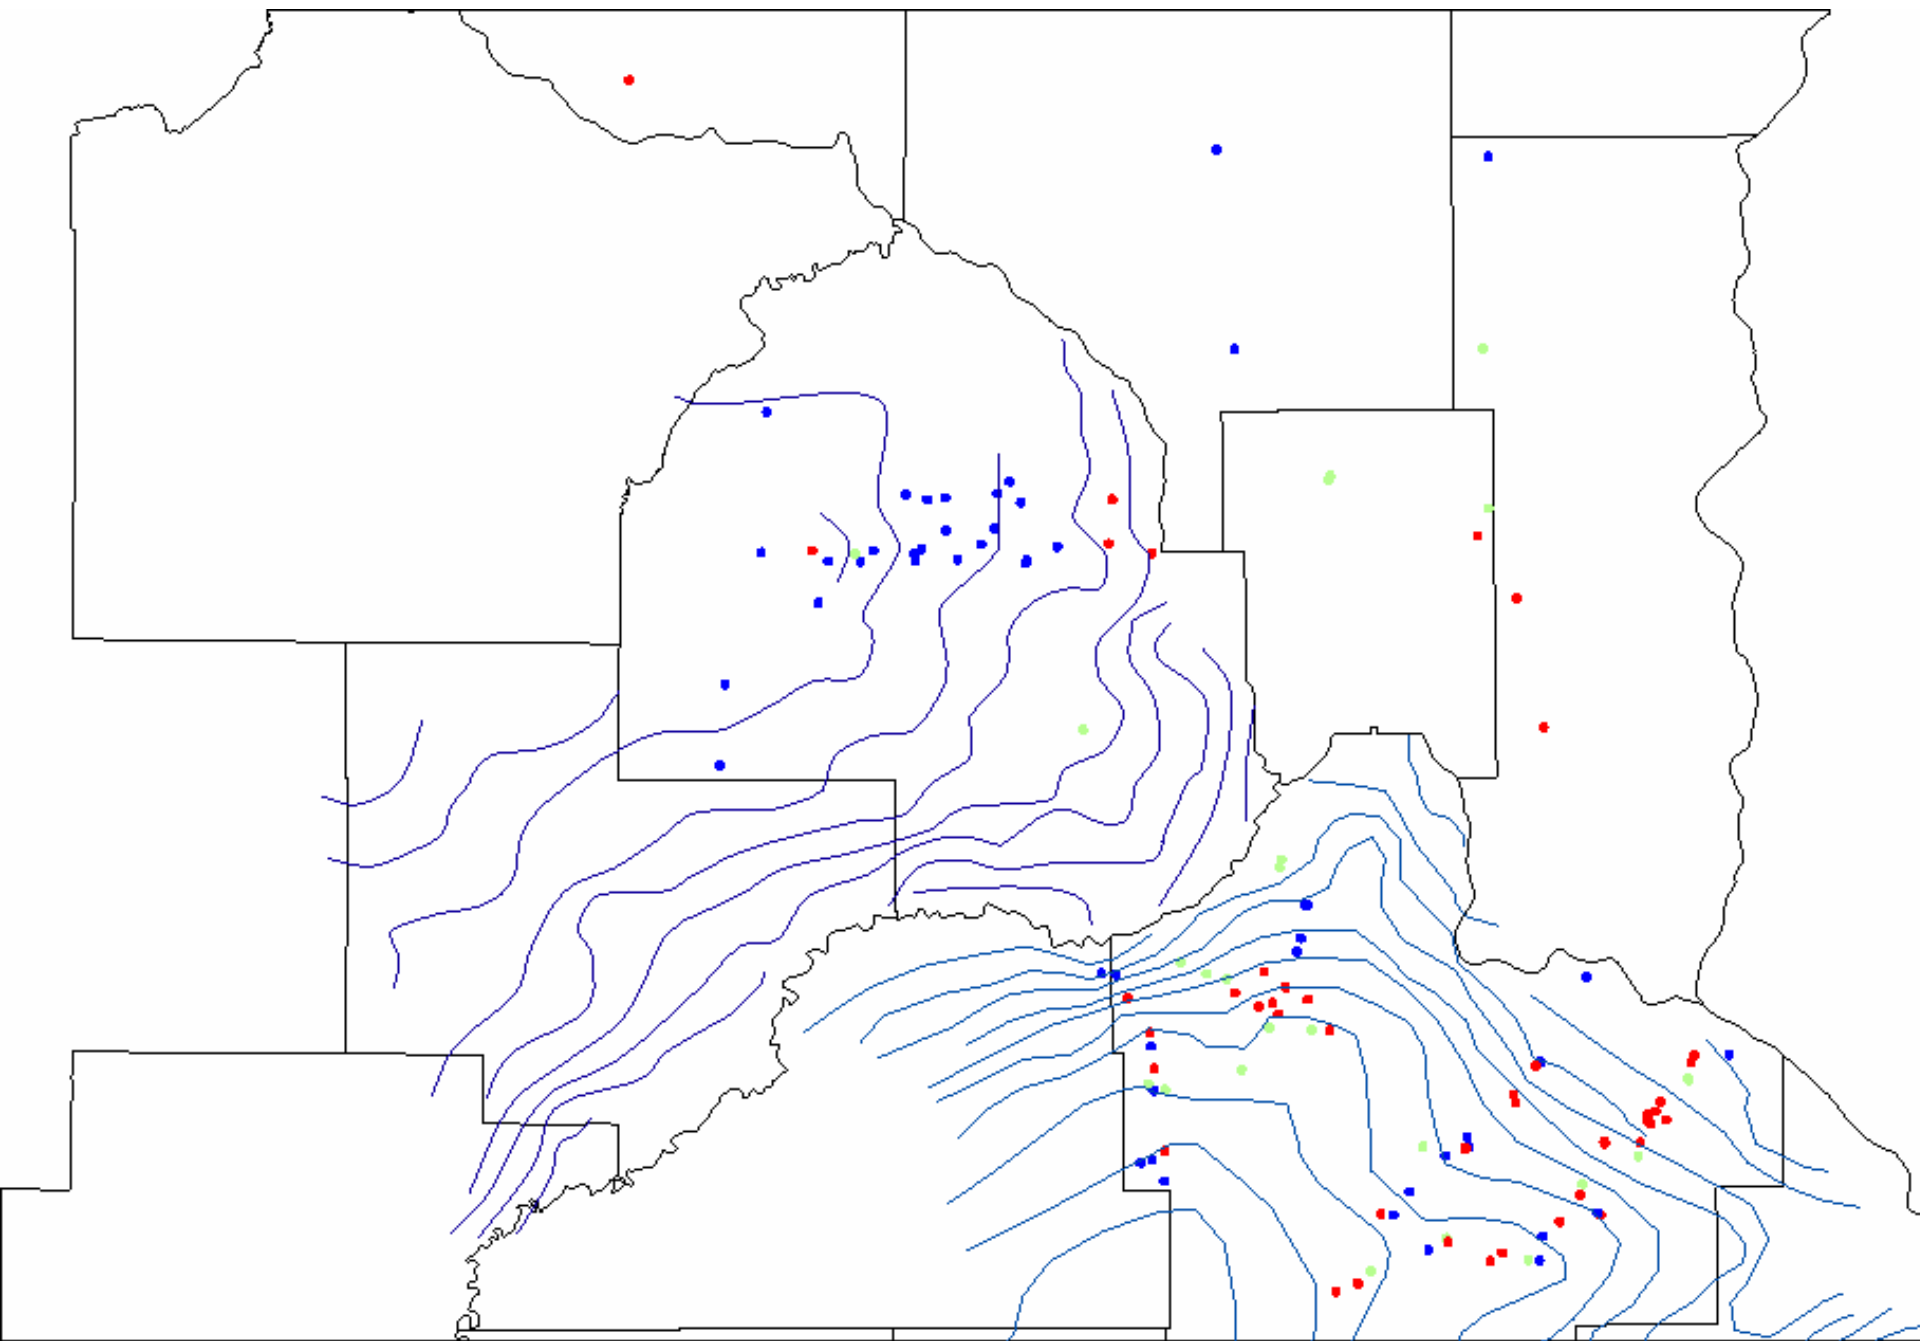

Figure 10. Piper Diagrams for water-chemistry samples from the Cedar Valley, Galena, St. Peter, Prairie du Chien, Jordan, and Franconia-Ironton-Galesville formations.

Tritium,
chloride and
PFC data

- Chemical data provide a valuable tool for tracing ground-water flow paths
- Deviations from background concentrations help identify zones of preferential flow within bedrock aquifers
- Recognizing regional patterns in chemical data help refine conceptual models of ground-water flow

Sources of historic data presented in this talk:

- The United States Geological Survey NAQWA program along with additional data from the National Water Inventory System (NWIS)
- The Minnesota Department of Health
- The Minnesota Pollution Control Agency GWMAP program – both ambient ground-water monitoring and land-use studies
- University of Minnesota graduate studies (Tipping, 1992; Nemetz, 1993; Burman, 1995)
- Anoka County Community Health and Environmental Services (Marsh, 1996; Marsh 2001).
