

AQUIFER RECHARGE: A SHAKOPEE MDEWAKANTON SIOUX COMMUNITY PILOT

April 22, 2014
PROJECT

MGWA Spring Conference

Ole Olmanson P.G.

SMSC Water Resources Scientist

Overview

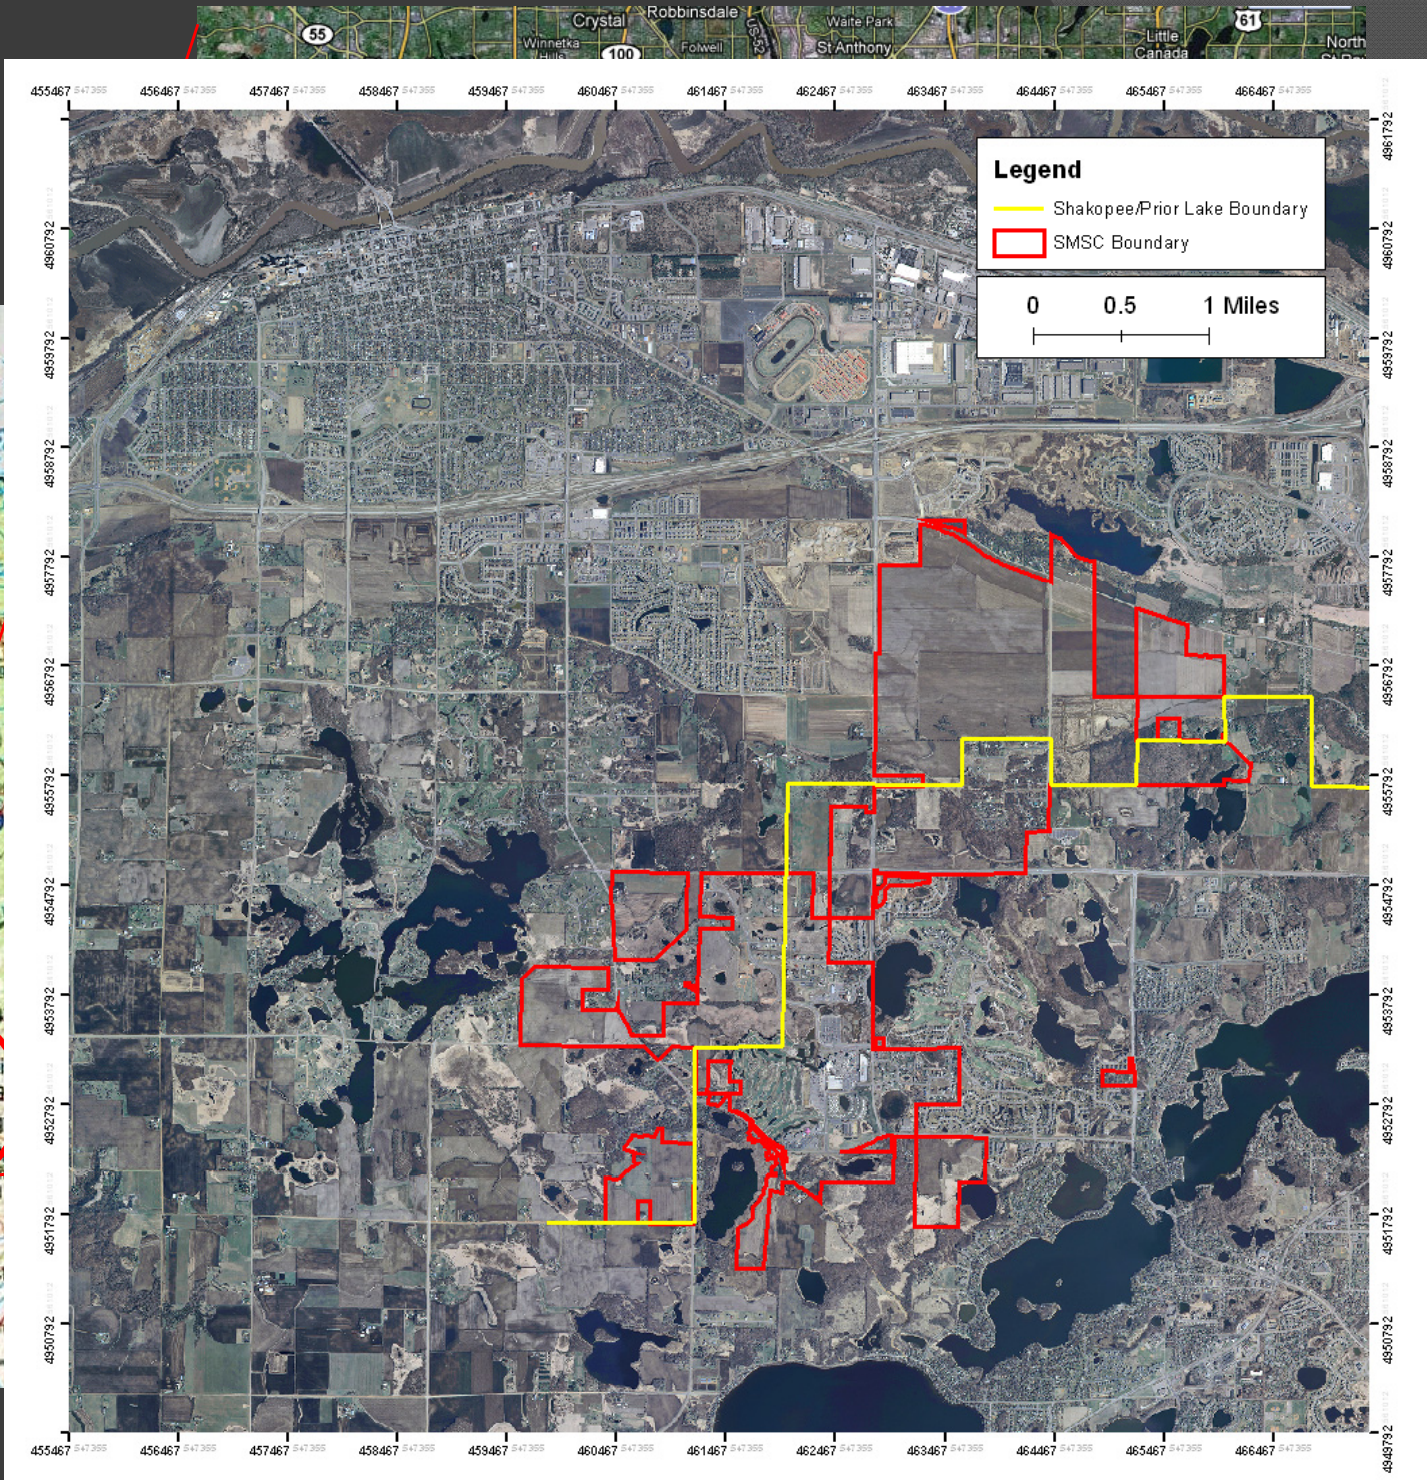

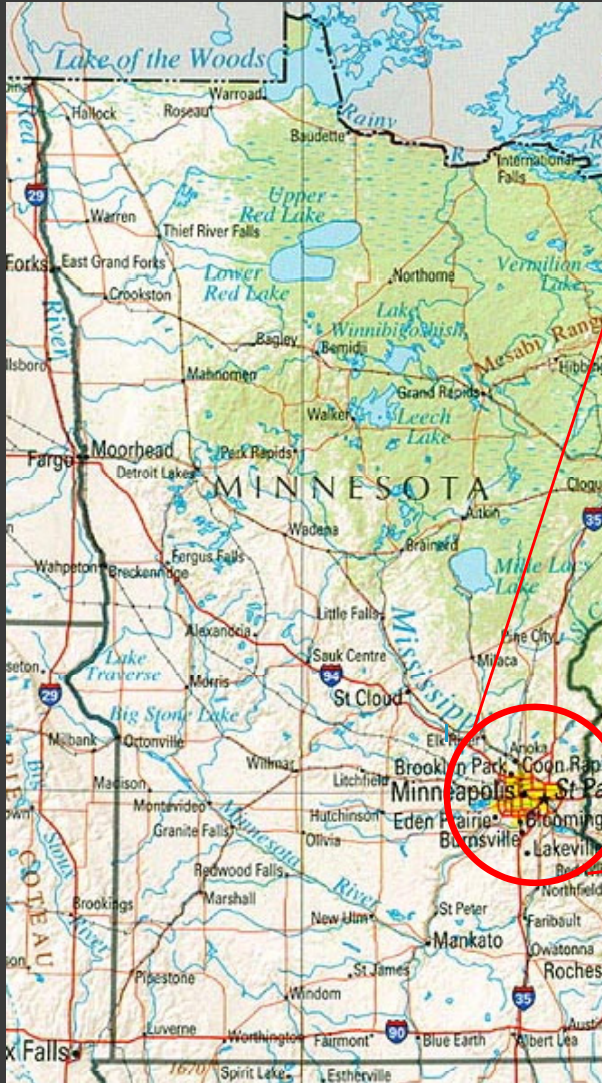

- Community profile
- Geologic setting
- Current water system
- Modeling
- Treatment tests
- Column tests
- System specifications

Shakopee Mdewakanton Sioux Community (SMSC) Specifics

- ⦿ Federally recognized tribe
 - Not subject to MN authority
 - Population - 325
- ⦿ About 3900 acres
 - Geographically constrained
- ⦿ Strives for self sufficiency
 - Enterprises/services
- ⦿ Effective population of 15,000 people

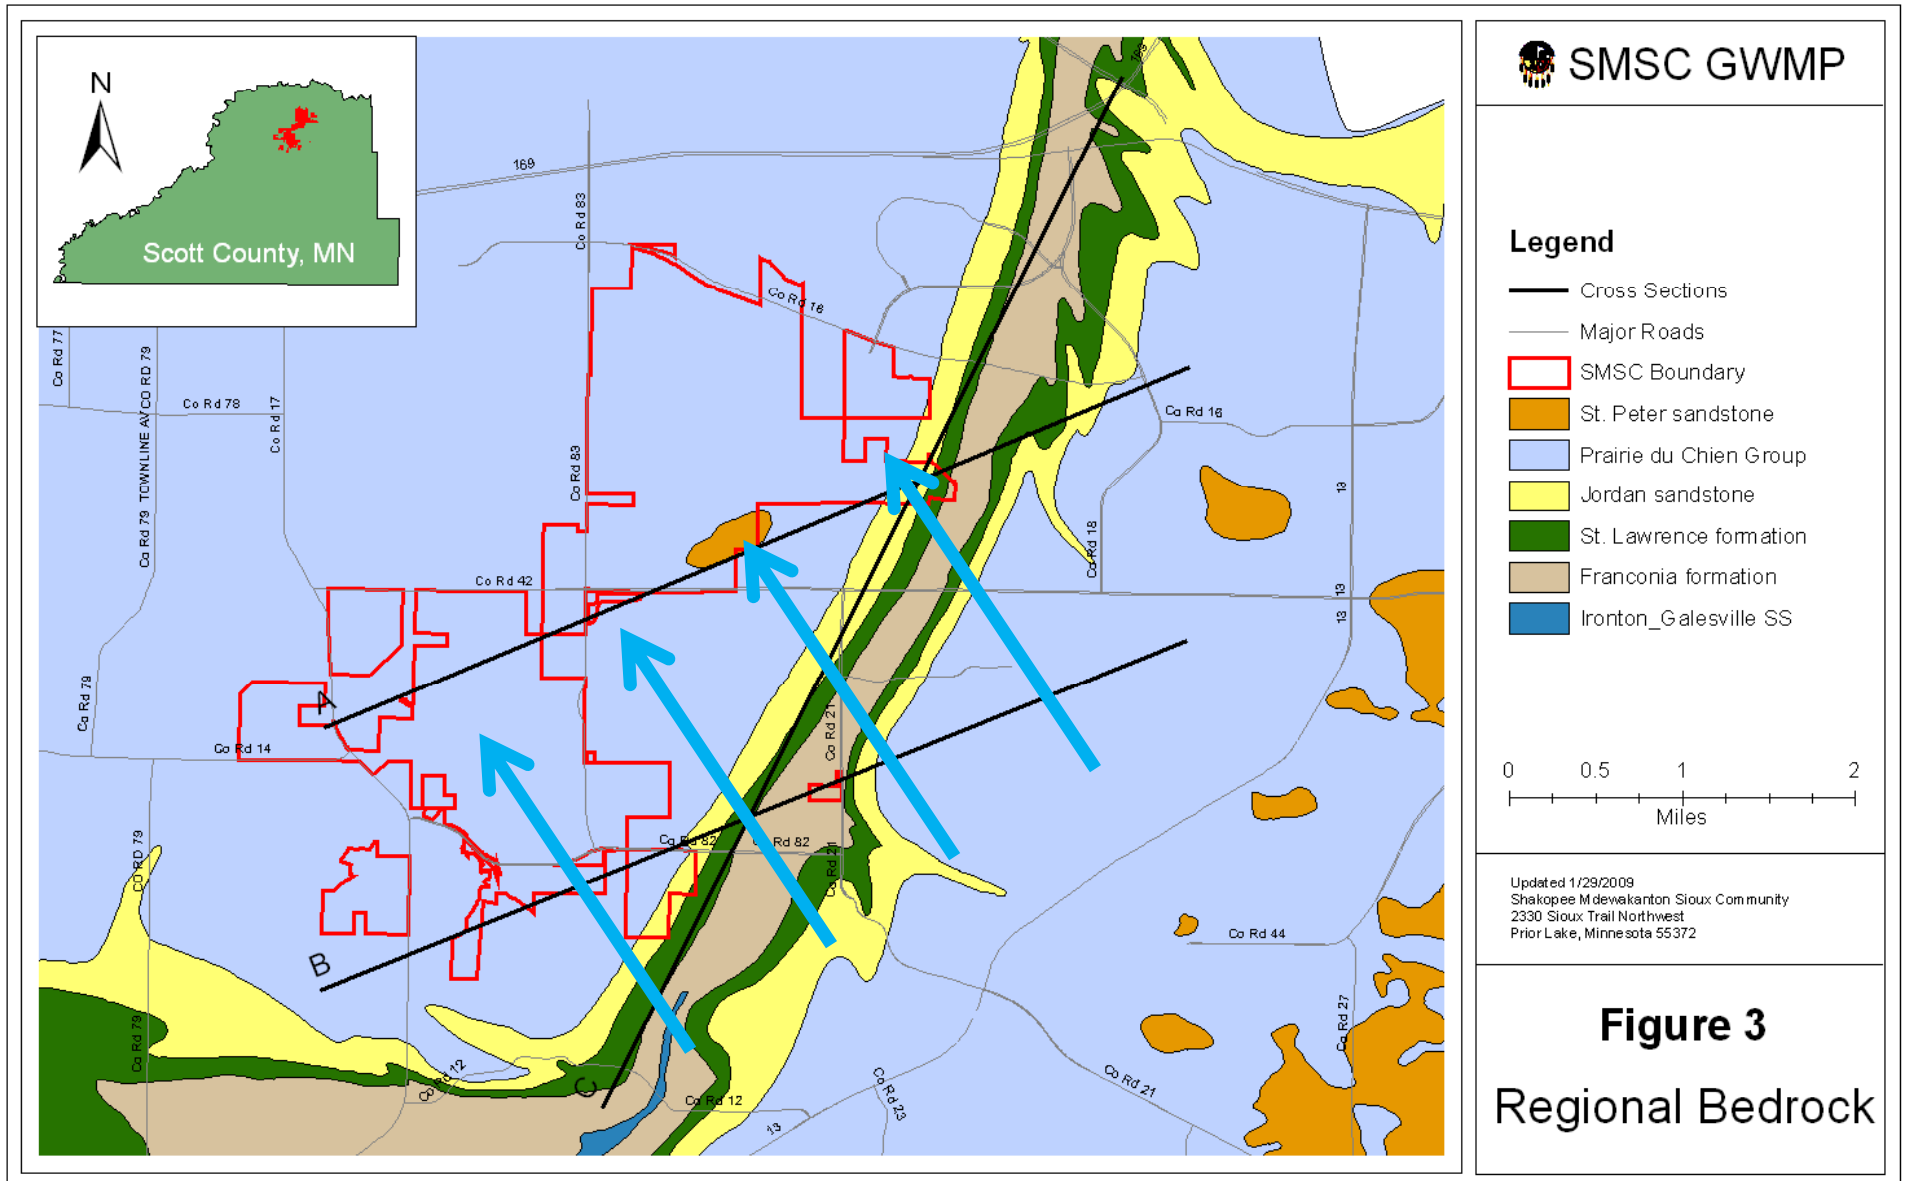

Location

Water Supply and Treatment

- 3 production wells – 2 Jordan, 1 deeper
 - 190 million gallons per year
 - Drinking water treatment
 - Iron and manganese
 - Reverse osmosis
- Modern waste water treatment
 - 145 million gallons treated annually
 - Discharged to surface water
 - Capable of treating 900 million gallons/year

Geologic Features

Why inject?

- Growing population
- Increased pumping
- Predicted drawdown
- Higher elevation
- Effluent is lost

2030 Model-4 in the Prairie

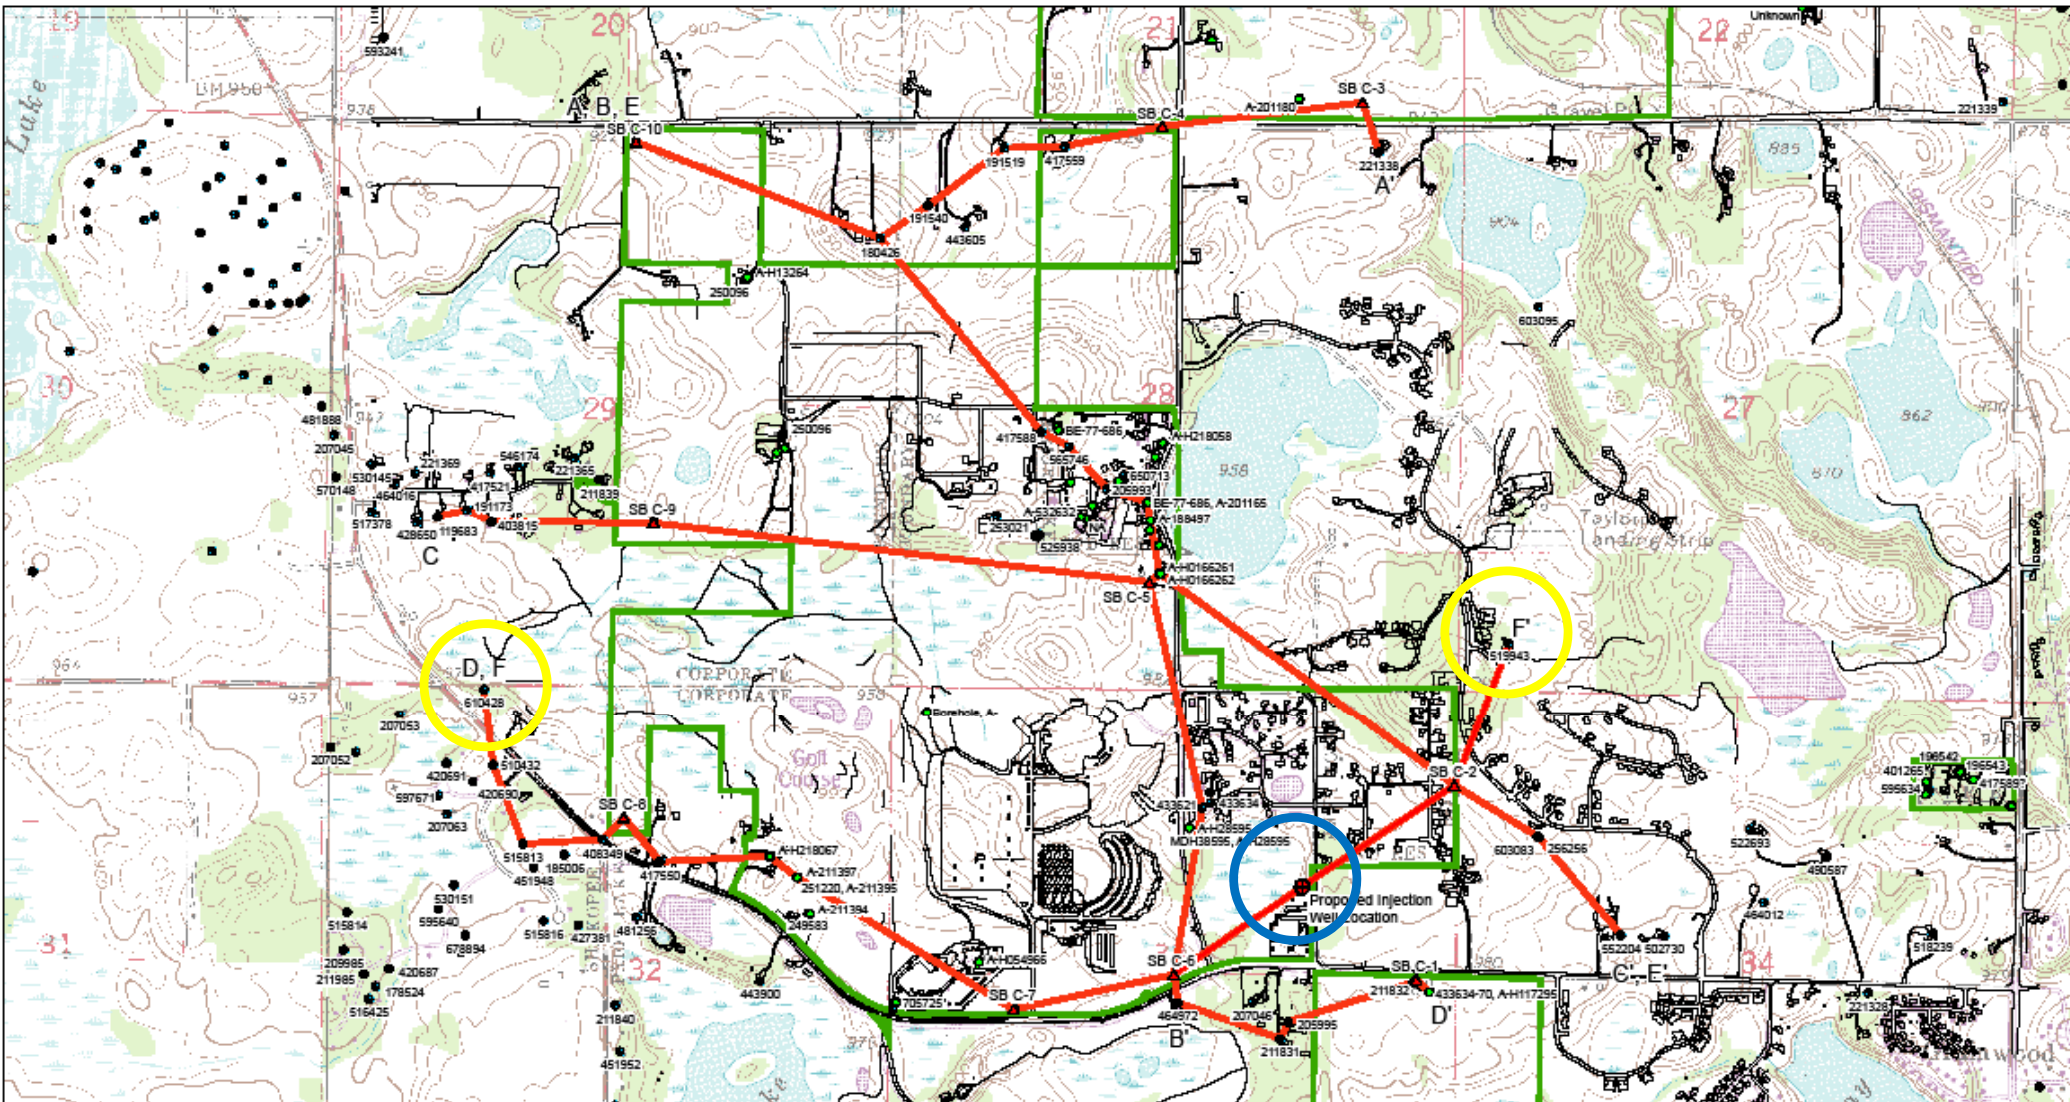

Decline:

Note: These model term average cond development of tra Summer conditions short-term drawdov

Injection specifications

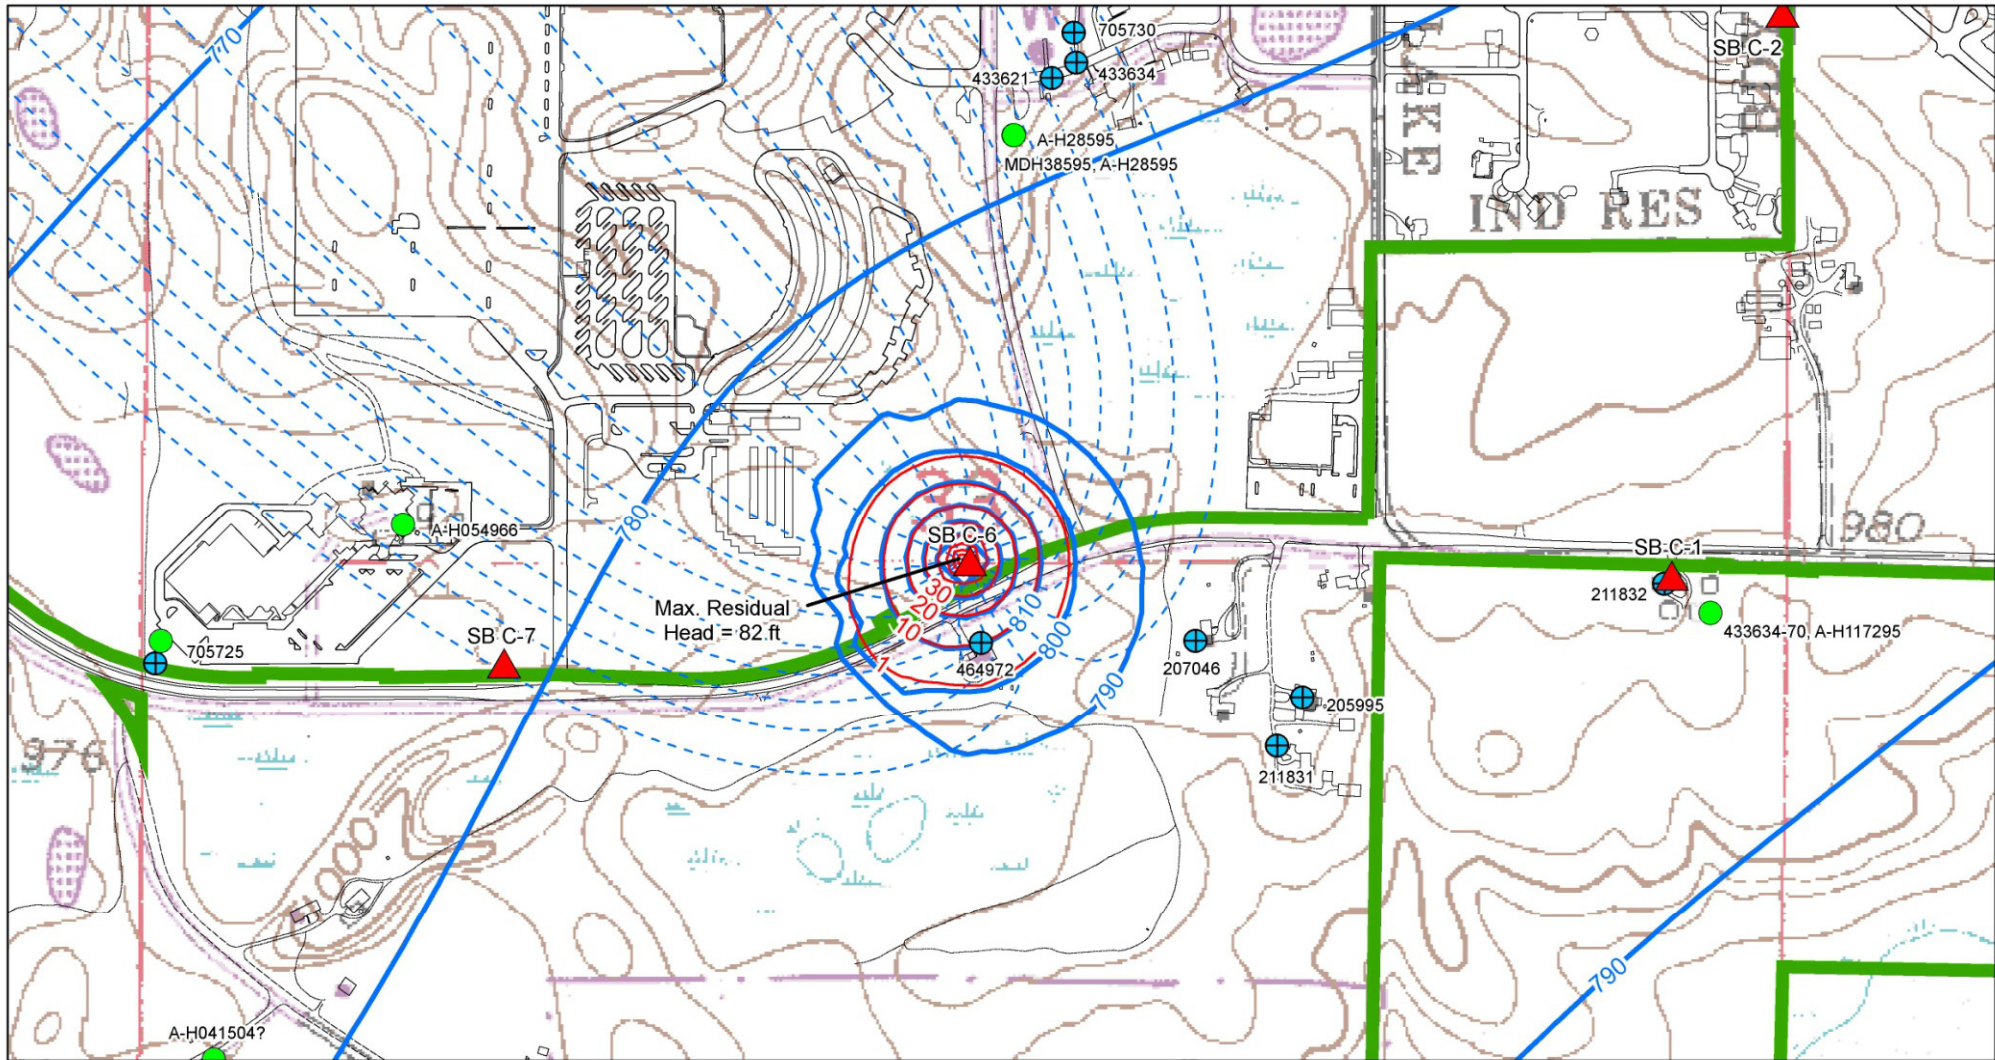

- Well will be screened across the entire gravel layer directly above the aquifer
- Seasonal – injection for 5 months during the fall, winter, and spring each year
- 100% of the fully treated stream injected
- Currently have about 300 gpm available (400k gpd)
- Can go as high as 1332 gpm (1.9M gpd)

Modeling 2006

Simulation	Injection rate gpm	Layer 1 Hydraulic conductivity (ft/day)		Layer 2 Hydraulic conductivity (ft/day)	
		K_h	K_z	K_h	K_z
1	450	25	2.5	40	4
2	900	25	2.5	40	4
3	1332	25	2.5	40	4
4	1332	25	2.5	40	0.04

Simulation	Injection rate gpm	Water table elevation at injection well		Change in head (ft)	Head space remaining
		Pre-injection	Post- injection		
1	450	783	834	51	149
2	900	783	861	78	122
3	1332	783	882	99	101
4	1332	783	958	171	25

Levels at max pumping

Water Quality Goals

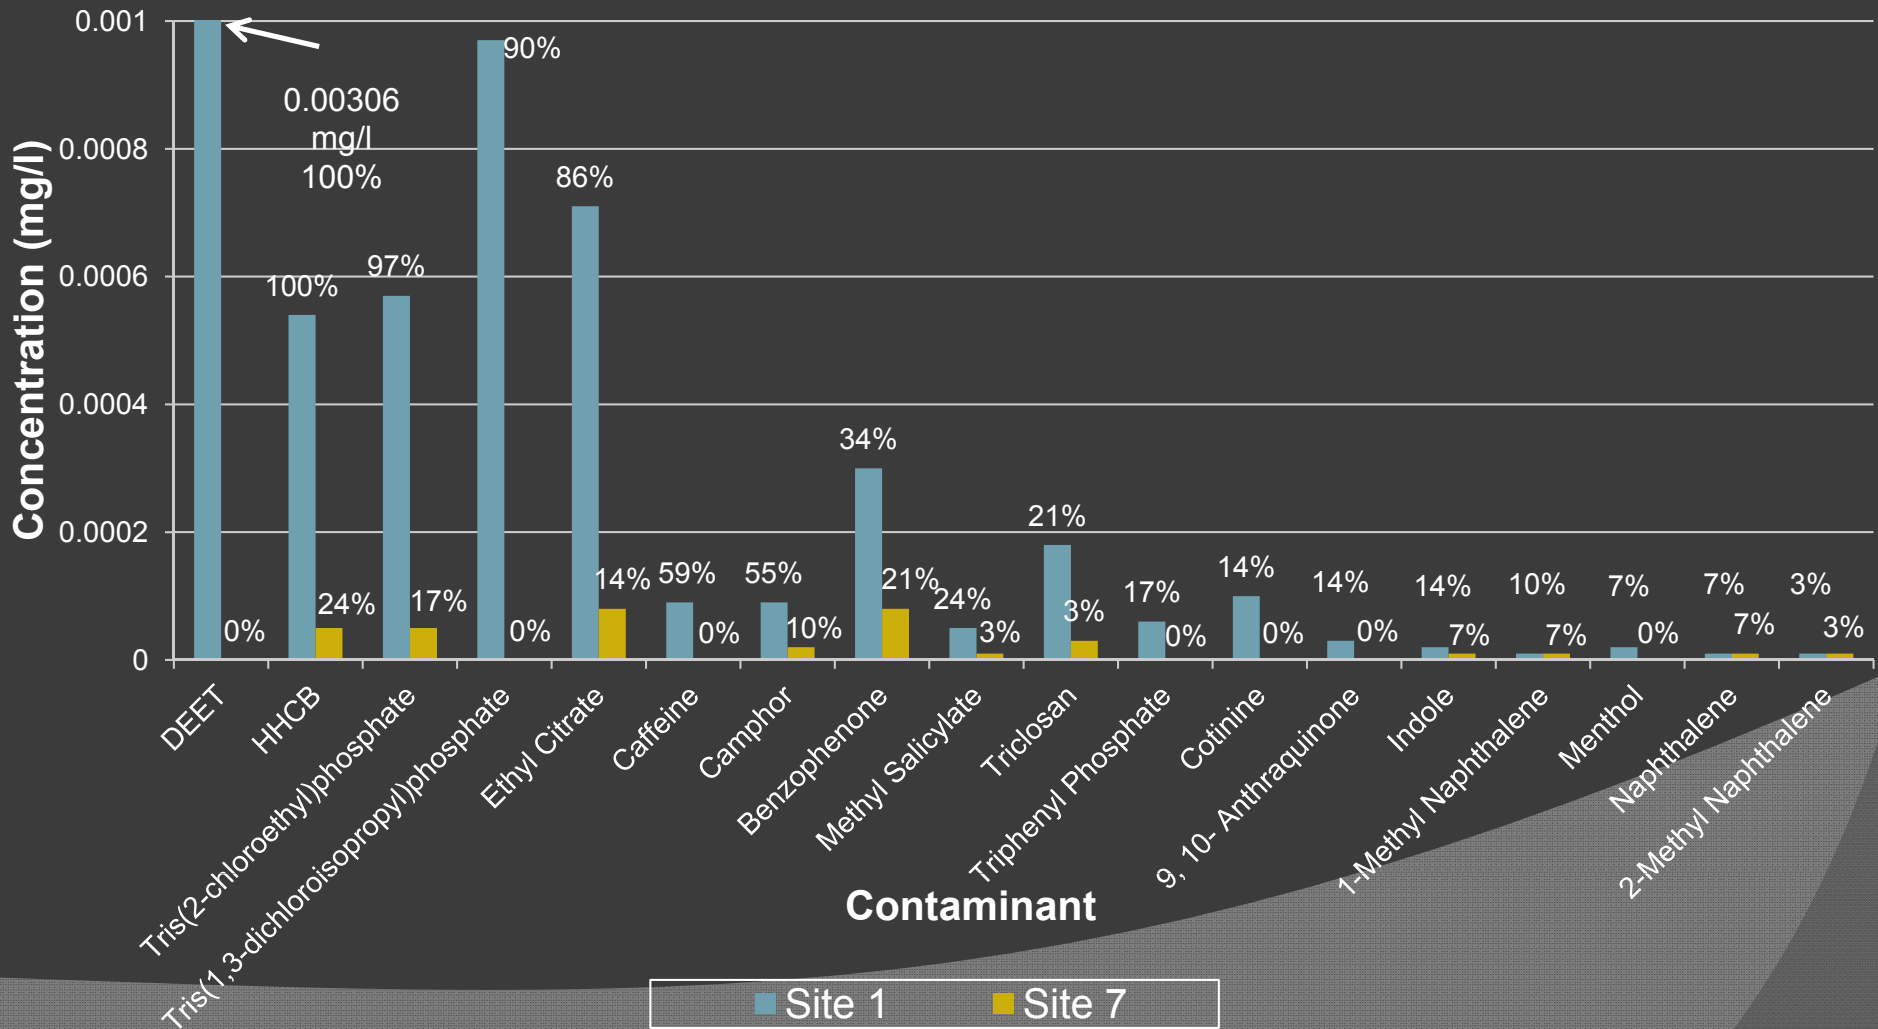

- ⦿ Return water in as good or better condition
- ⦿ EPA
 - National Primary Drinking Water Standards
 - National Secondary Drinking Water Standards
 - Contaminant Candidate List (CCL3)
- ⦿ MDH Human Health-Based Water Guidance Table
- ⦿ California Drinking Water Notification Levels
- ⦿ Additional contaminants

Final List

- ◎ 52 contaminants that represent
 - Particular classes e.g. pharmaceutical, personal care products, or industrial chemicals
 - Diverse properties
 - Common and affordable measurement
 - Expected to be found locally
 - Health or environmental risk

Test Results

Most Common Contaminants Detected (June – September 2010)

Removal Summary

- ⦿ Pilot treatment removed
 - 61% mass of all measured contaminants
 - Many below detectable limits
- ⦿ Remaining contaminants far below health based risk levels

Ready to Inject?

- Great results
- Clean, drinkable water
- Turn on the pumps

- Not quite
- Need to consider properties of receiving body
 - pH – hardness – mineral types
- Need more tests

Batch Testing

- ⦿ What happens when treated water contacts the geologic units?
 - Iron oxidation could plug screen
 - PDC could dissolve
 - Mobilization of arsenic, lead, mercury etc.
- ⦿ Test A
 - Combined sand and gravel unit and PDC
 - Treated water and various treatments of lime and CO₂
 - No problematic constituents were mobilized

Batch Testing

● Test B

- Water treated with 55 mg/L lime and used CO₂ to adjust pH to 7.5
- Test environments representative of various depths
- Arsenic reported in low concentrations for 25% of samples

Column Tests

- Determine effects of treated water moving through aquifer
- Original borehole cores saved
- Treated water run through
- Two tests
 - pH adjusted with CO₂ + lime
 - No pH adjustment

SMSC Water Reuse Pilot Study

Sample Locations for Emergent Contaminants Analysis

Sample Type

- 24 Hour Composite Sample
- Grab Sample

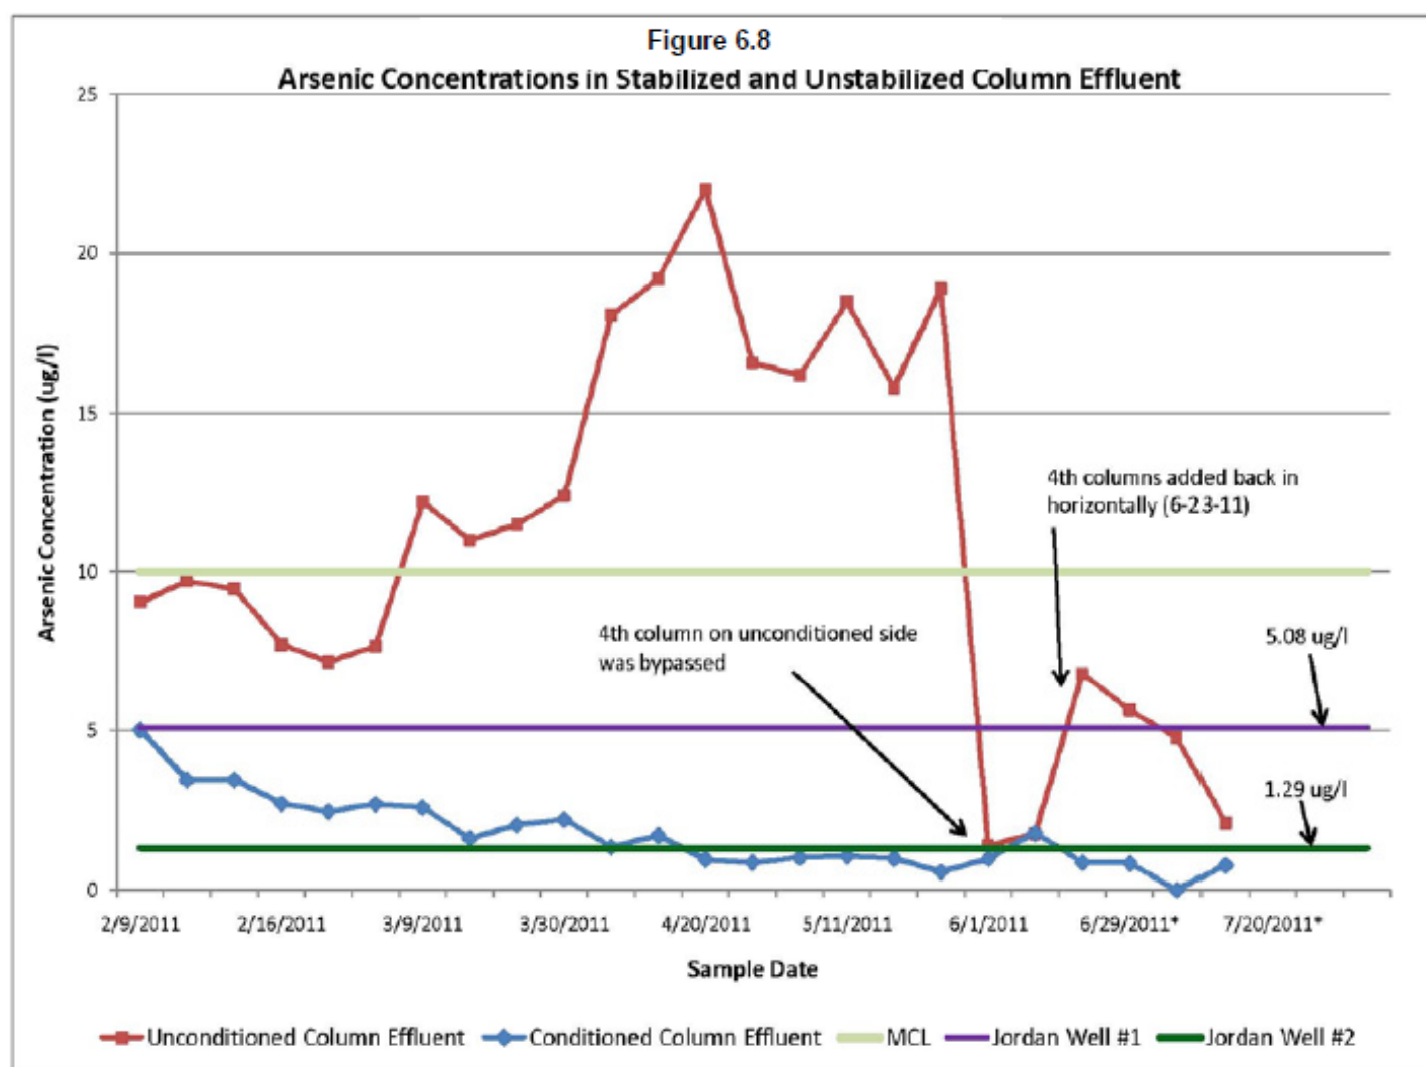

Sample Locations

- 1 WWTP Effluent
- 2 RO Permeate
- 3 RO Reject
- 4 After UV/Peroxide Treatment
- 5 After Ozone/Peroxide Treatment
- 6 After UV/Ozone/Peroxide Treatment
- 7 Fully Treated Water
- 8 Column Influent (Un-stabilized)
- 9 Column Influent (PH adjusted)
- 10 Column Effluent (Un-stabilized)
- 11 Column Effluent (PH adjusted)

BOLTON & MENK, INC.
Consulting Engineers & Surveyors

Column Test Results: Arsenic

Column Test Results

● Stabilized water

- Calcium – similar influent/effluent
- Total Dissolved Solids – slight increase
- Magnesium, Silicon, Strontium – increase less than unstabilized
- Sodium, Potassium, Aluminum, Barium – increase similar to unstabilized

Proposed System

- Drill 3 wells
- 2 in operation at any time
- 350,000 gallons per day

- Status
 - On hold indefinitely
 - Installed irrigation reuse system

Summary

- Area has adequate water
- Predicted future drawdown
- SMSC has
 - Geologic advantage
 - Existing facilities
- Testing shows that water quality can be assured
