Eleven Orders of Magnitude: The Range and Implications of Karst Recharge Rates

George Veni, Ph.D.
Executive Director
National Cave and Karst Research Institute
Carlsbad, New Mexico USA

Karst: A Major Global Terrain

The first draft of the World Karst Map was shown on this slide, but it is not ready for public distribution and has been deleted from this distributed version. Apologies! Please watch for the final version to be published in 2016!

Why Should I Care About Caves and Karst?

- **Critical water supply**

About 41 million people in the USA depend on karst aquifers as their only or primary source of water

What is Karst?!

Karst is a landscape, formed primarily by dissolution of the bedrock, typically:

- limestone
- dolomite
- marble
- gypsum
- halite

How do Karst Aquifers Form?

Fractures capture water and are enlarged into conduits

How do Karst Aquifers Form?

Fractures capture water and are enlarged into conduits

As conduits enlarge, they capture water from surrounding fractures and enlarge at ever-increasing rates

How do Karst Aquifers Form?

Fractures capture water and are enlarged into conduits

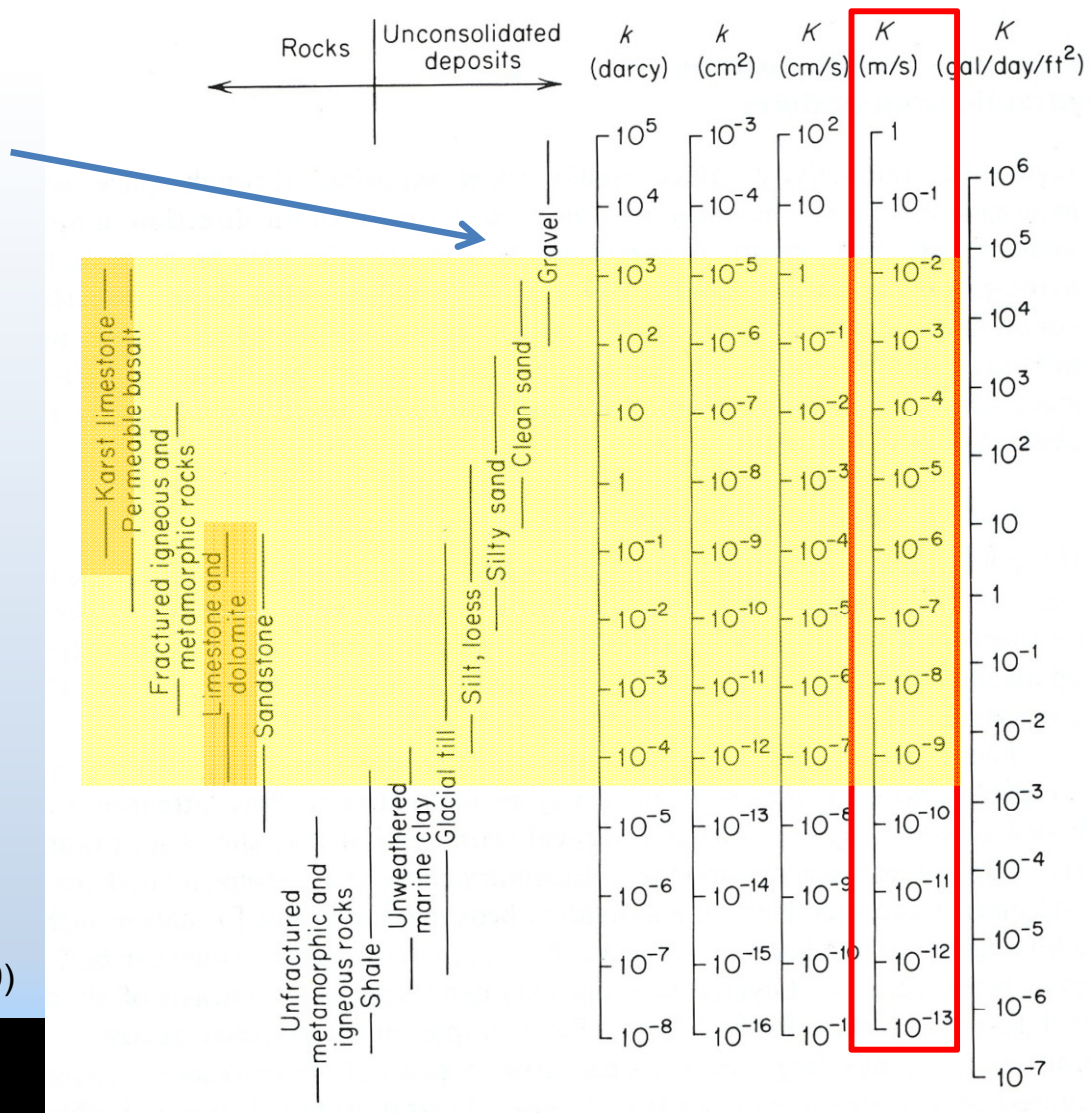

As conduits enlarge, they capture water from surrounding fractures and enlarge at ever-increasing rates

When the conduit becomes large enough for human entry, it is called a “cave”

Permeability of Karst Aquifers

Table 2.2 Range of Values of Hydraulic Conductivity and Permeability

	k (darcy)	k (cm^2)	K (cm/s)	K (m/s)	K (gal/day/ft^2)
Gravel	10^5	10^{-3}	10^2	1	10^6
Clean sand	10^4	10^{-4}	10	10^{-1}	10^5
Silty sand	10^3	10^{-5}	1	10^{-2}	10^4
Silt, loess	10^2	10^{-6}	10^{-1}	10^{-3}	10^3
Unconsolidated deposits	10	10^{-7}	10^{-2}	10^{-4}	10^2
Rocks	1	10^{-8}	10^{-3}	10^{-5}	10
Karst limestone	10^{-1}	10^{-9}	10^{-4}	10^{-6}	1
Permeable basalt	10^{-2}	10^{-10}	10^{-5}	10^{-7}	10^{-1}
Fractured igneous and metamorphic rocks	10^{-3}	10^{-11}	10^{-6}	10^{-8}	10^{-2}
Limestone and dolomite	10^{-4}	10^{-12}	10^{-7}	10^{-9}	10^{-3}
Sandstone	10^{-5}	10^{-13}	10^{-8}	10^{-10}	10^{-4}
Unfractured metamorphic and igneous rocks	10^{-6}	10^{-14}	10^{-9}	10^{-11}	10^{-5}
Shale	10^{-7}	10^{-15}	10^{-10}	10^{-12}	10^{-6}
Unweathered marine clay	10^{-8}	10^{-16}	10^{-11}	10^{-13}	10^{-7}
Glacial till					

Karst is comparable to sand and less permeable than gravel?

“Typical” range of karst permeability

Adapted from: Freeze and Cherry (1979)

Permeability of Karst Aquifers

Which sinking stream is more permeable?

Triple-Permeability Flows in Karst Aquifers

Diffuse flow

Laminar and very slow groundwater movement within small voids of primary and secondary porosity, excluding conduit and fracture flow; “intergranular” flow.

Triple-Permeability Flows in Karst Aquifers

Fracture flow

Groundwater movement along fractures and bedding planes that usually have been enlarged by solution. Flow is laminar to turbulent, and generally constitutes a moderate to large volume of groundwater in karst aquifers.

Triple-Permeability Flows in Karst Aquifers

Conduit flow

Groundwater movement along conduits; usually rapid and turbulent.

Conduit: Subsurface bedrock channel formed by solution to transmit groundwater; often synonymous with cave and passage, but generally refers to channels either too small for human entry and $>5\text{-}10\text{ mm}$ in width.

Triple-Permeability Flows in Karst Aquifers

Groundwater problems: sampling bias

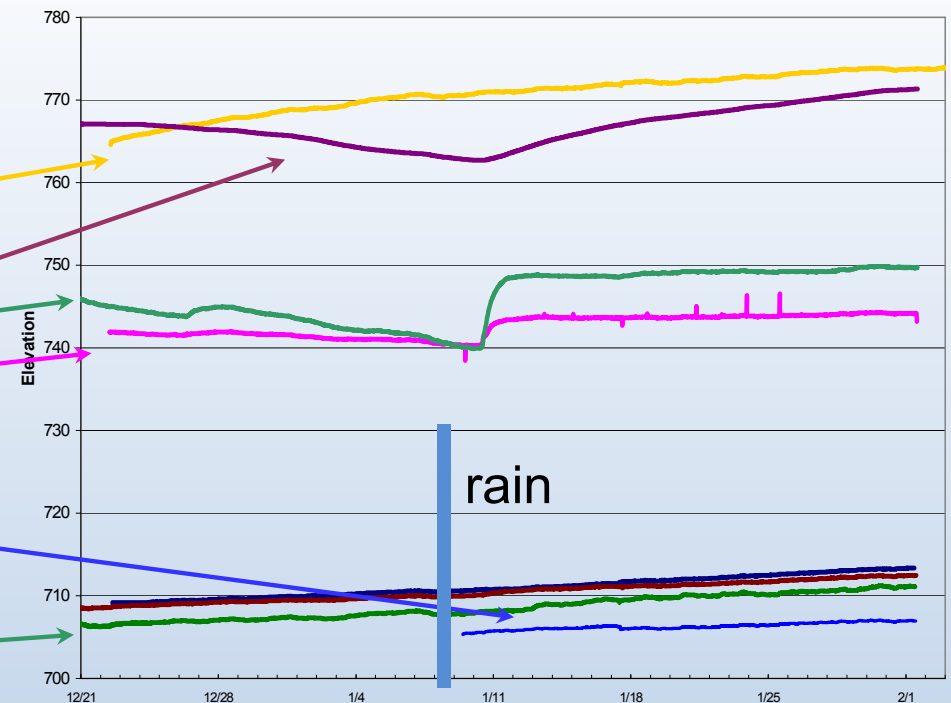

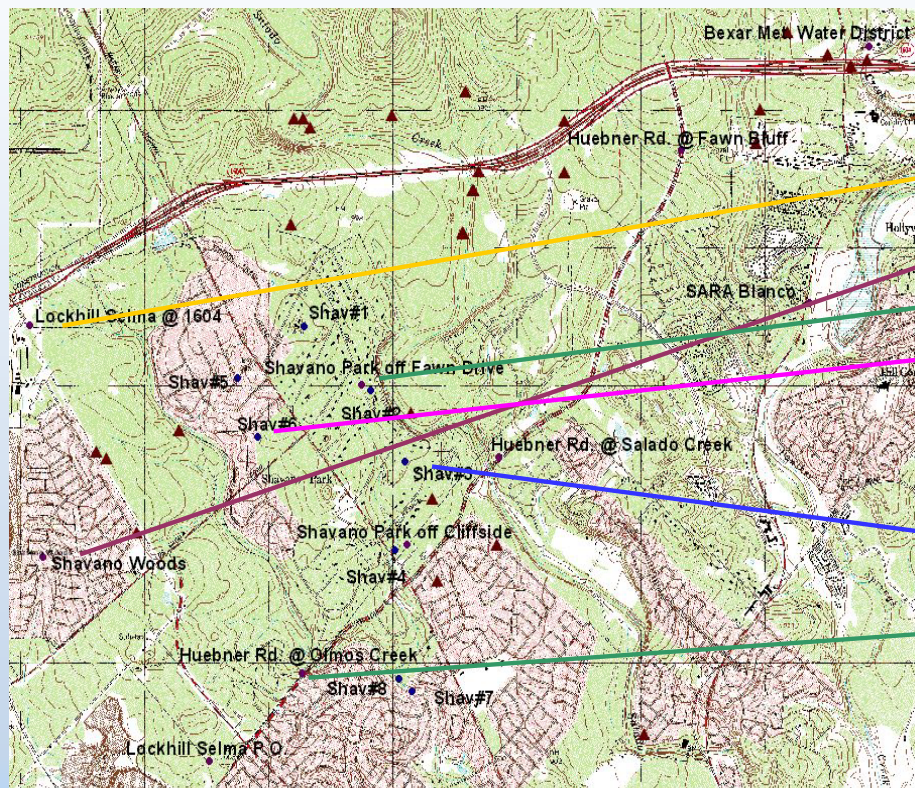

From: ASTM (1998)

Triple-Permeability Flows in Karst Aquifers

Well vs. spring data

- Wells give site-specific data
- High variability exists between adjacent wells

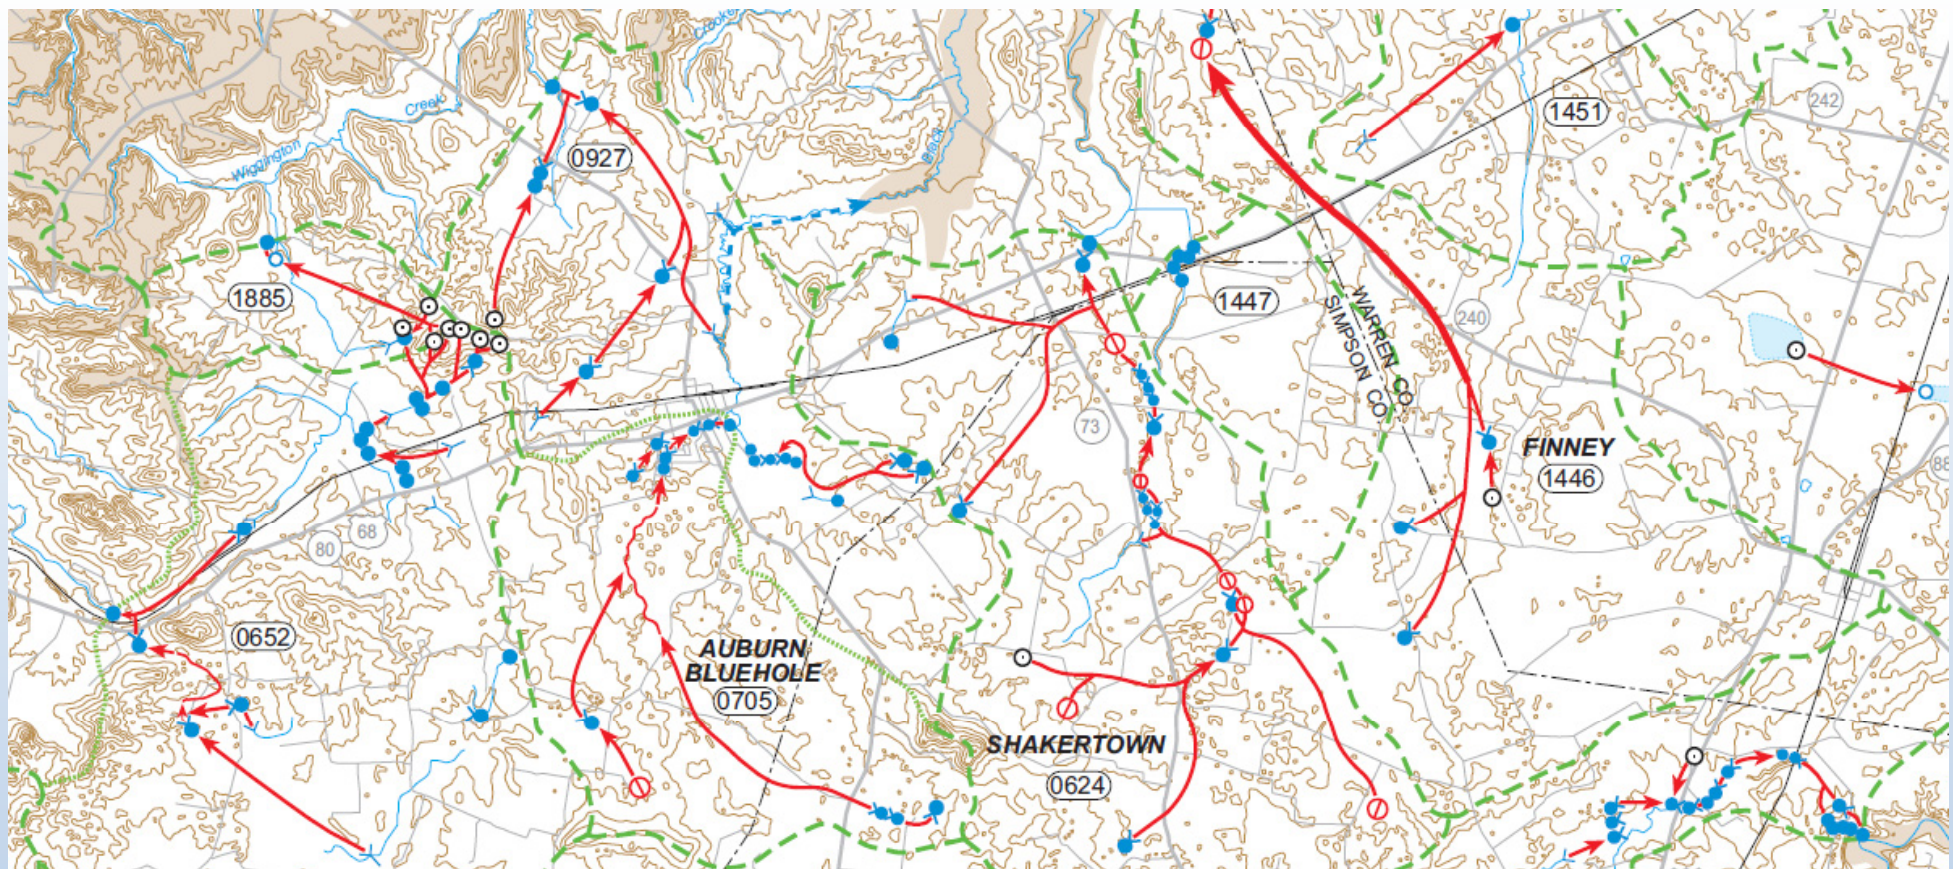

Map and data courtesy of Edwards Aquifer Authority (2001)

Triple-Permeability Flows in Karst Aquifers

Well vs. spring data

- Springs give drainage basin data

From: Ray and Currans (2001)

Permeability and Groundwater Storage

Storage of groundwater in conduits vs. diffuse and fractures

- How much water occurs in conduits?
Conduits store ~6%
Conduits move ~99%

Environmental Implications of Karstic Permeability

Groundwater problems: contamination

- Rapid recharge and groundwater travel time
- Effectively no filtration

Environmental Implications of Karstic Permeability

Groundwater problems: contamination

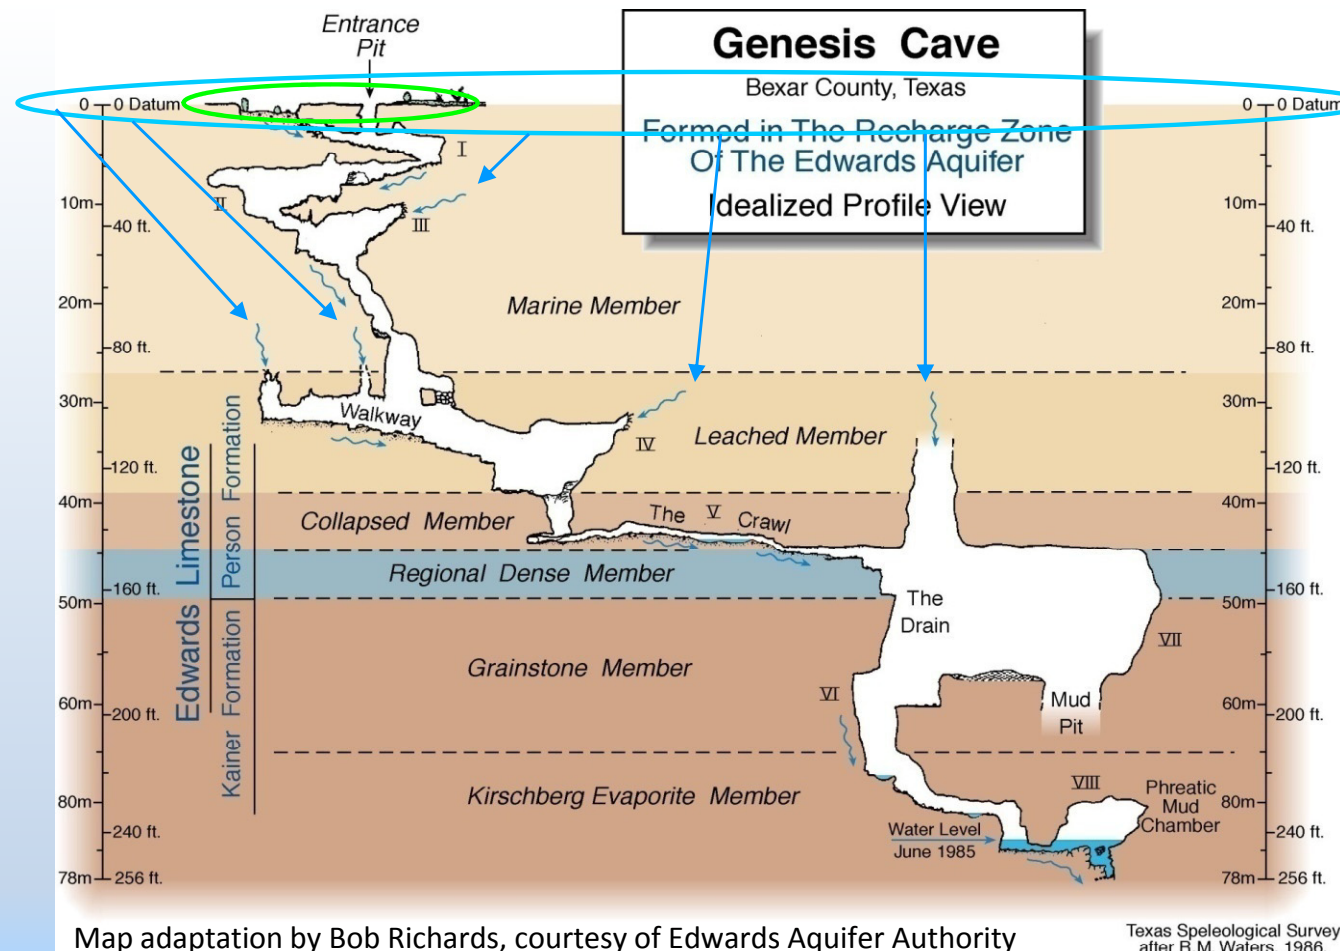

- Karst recharge allows groundwater contamination from solid waste

Environmental Implications of Karstic Permeability

Groundwater problems: contamination

- Conduit size is not a factor in preventing contamination

Environmental Implications of Karstic Permeability

Groundwater problems: contamination

- Conduit size is not a factor in preventing contamination
- Neither is the absence of caves and sinkholes

Recharge rate:

2 L/minute

Total recharge:

86,400 L

(22,810 gallons)

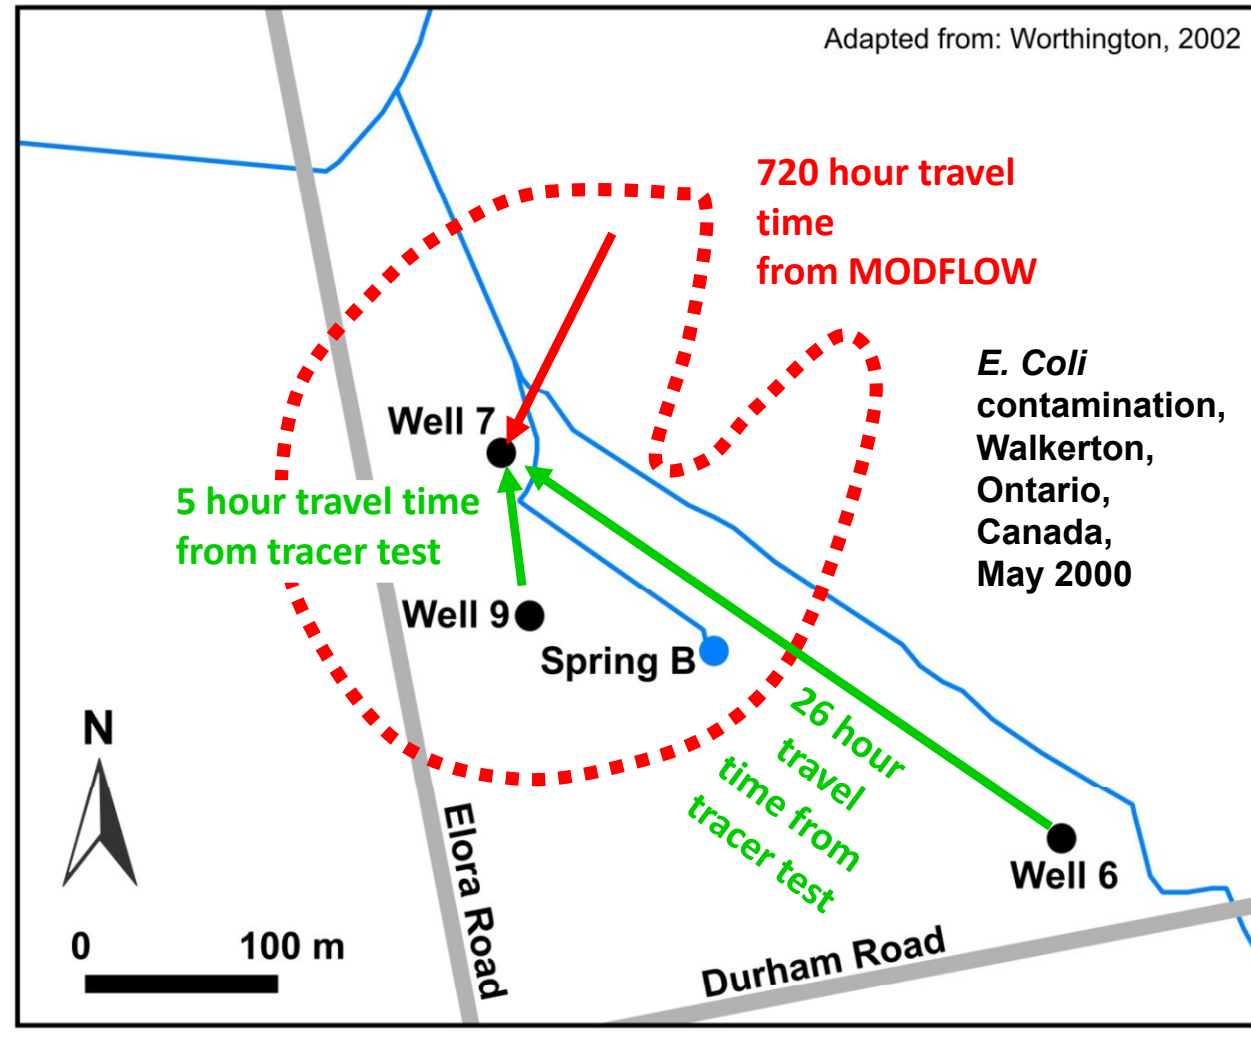

Environmental Implications of Karstic Permeability

Groundwater problems: contamination

- Conduit size is not a factor in preventing contamination
- Neither is the absence of caves and sinkholes

7 dead, 2,300 ill

Environmental Implications of Karstic Permeability

Monitoring contaminant movement

- Typical contaminant monitoring in porous media aquifers

Environmental Implications of Karstic Permeability

Monitoring contaminant movement

- No true plumes in karst aquifers
- Spring and conduit monitoring is necessary

Adapted from: Missouri Department of Natural Resources

Environmental Implications of Karstic Permeability

Monitoring contaminant movement

- Variable movement depending on which flowpaths the contaminants move and are stored

Environmental Implications of Karstic Permeability

Monitoring contaminant movement

- Variable movement depending on which flowpaths the contaminants move and are stored

Environmental Implications of Karstic Permeability

Groundwater problems: water quantity

- Karst aquifers have a high capacity for rapid recharge and rapid discharge

Environmental Implications of Karstic Permeability

Groundwater problems: water quantity

- Finding water
- Dry wells
- Water table??

From: Edwards Underground Water District & Edwards Aquifer Research and Data Center, 1981

Environmental Implications of Karstic Permeability

Groundwater problems: water quantity

- Karst flooding
